Safety Signal Review Capstone

Review a small aggregate safety dataset and prepare a professional signal-assessment briefing.

Objective

Combine case review, descriptive statistics, evidence grading, and risk communication.

Deliverable

Signal assessment report and five-slide safety review presentation.

Do these steps to pass

• Summarize case counts, seriousness, outcomes, and reporting trends.

• Identify one potential signal and relevant alternative explanations.

• Propose follow-up evidence and risk-minimization questions.

• Document calculations and limitations.

• Complete the quality-control checklist.

Submission

Submit one public or view-only link. Put supporting files in the same repository, folder, or project page so one link is enough.

Training boundary

The screenshot refers to a supplied aggregate CSV that is not attached in this chat. Therefore this package uses a clearly labelled synthetic dataset created solely for practice. Replace it with the official supplied dataset if your course provides one.

Method note

Statistical disproportionality can help prioritize drug-event combinations for further investigation, but a statistical result is not itself proof of causality. EMA guidance emphasizes clinical context, data quality, and further evaluation.
